The Basics The basic function of Photoshop is simple: You can change the color, lightness, and brightness of pixels on a layer. Any picture can have multiple layers. Layers can also be grouped together to make a single picture. A layer is like a cookie for Photoshop — it's where all of the work gets put. You don't really see this cookie in your picture. It can be stacked on top of other layers, allowing you to edit areas on top of one another. Each layer can be adjusted separately, and each adjustment can be varied by the amount chosen by the user. Photoshop layers can also be grouped

together to create Photoshop layers that can be modified together (the same cookie in an American bakery). You can create each cookie individually, or you can make a whole batch for your family with a mixer. Once you've made these adjustments, you can save them to your computer as a file. You can use Photoshop to make these alterations or make a print directly from Photoshop to a printer. Every pixel, either in color or grayscale, takes up a pixel on your computer screen. A pixel is a dot of color, and a computer can manipulate those dots to make one of a million colors. You can adjust a pixel's color by changing the color on the color bar at the bottom of the screen, where you choose red, green,

blue, and yellow. To change the intensity of the colors in a picture, you change the lightness of the pixels. There are different ways to do this, using sliders or using the Color Picker tool, which is a tiny dot you can press anywhere on the screen to pick a color. The brightness of the pixels can be adjusted by increasing the brightness of the image. For example, if you want to brighten an image, you would press and hold the option key on your keyboard and click the brightness slider. Illustration by Serge Gninin. File Structure Each image file contains layers, and each layer contains pixels. To work on a picture, open it using Photoshop. When you open an image, the default Photoshop window shows you the layers, grouped in various

tabs that allow you to edit a specific layer by clicking the appropriate tab. Grouping Layers Layers can be "grouped" together, meaning they can be combined for editing. To do this, you have to click the button at

1. Field of the Invention The present invention relates to a fuel injection control method for an internal combustion engine, and more particularly to a fuel injection control method for an engine which is equipped with a

secondary air supply system for purging the soot in a combustion chamber of the engine. 2. Description of the Prior Art A secondary air supply system is known in an internal combustion engine to purges carbon particles or soot from a combustion chamber. This system comprises a secondary air pump which causes a fuel-air mixture drawn from a fuel injection system to flow into the engine and a pipe to deliver the mixture to the engine. The fuel injection system may be of the so-called "constant-pressure type", in which fuel is injected from a fuel injection valve during the intake stroke of the engine, or "direct injection type", in which fuel is injected during the compression stroke of the

engine. These injection systems are both well known in the art. When the engine is operating, the heat is generated due to the pumping of the secondary air by the secondary air pump. Also the fuel injection system is normally located near the pump, and the fuel-air mixture is heated to a temperature substantially equal to that of the engine. It is, however, known that carbon particles or soot contained in the fuel-air mixture can be oxidized and removed as a result of the so-called "combustion of the soot in the engine". Some effort has therefore been made to improve the soot combustion. However, because the carbon particles or soot are powder, there has been found no effective means for reducing the soot

particles to a desired size. The present applicant has proposed the use of a secondary air control valve which controls the pressure of the fuel-air mixture supplied to the engine. In this apparatus, the secondary air pump is operated at a rate which varies in accordance with the opening angle of the secondary air control valve. This valve is typically made of magnetic material. A secondary air pressure control mechanism is also provided for adjusting the opening angle of the valve. In the control apparatus of this type, the amount of fuel-air mixture drawn by the pump is controlled so as to be proportional to the amount of intake air, and the valve opening angle is controlled in proportion to the opening

degree of a throttle valve so that the intake air will flow smoothly from the throttle valve to the engine. The fuel is drawn into the engine at an optimum injection rate. In the above-mentioned apparatus
